15. Mr. Adegoke Henry AKINWUNMI	Hostel Manager II	Hall of Residence
16. Miss. Jumoke Grace DAIRO	Hostel Manager II	Hall of Residence

### Nature's Corner by Dr. Kola Farinloye Water

Water covers almost 71% of the Earth's surface. Of this, 97.5% is the salty water of the oceans and only 2.5% freshwater, most of which is locked up in the Antarctic ice sheet toward the south pole of the globe. The remaining freshwater is found in glaciers, lakes, rivers, wetlands, the soil, aquifers and atmosphere. Due to the water cycle, fresh water supply is continually replenished by precipitation, however there is still a limited amount necessitating management of this resource. Awareness of the global importance of preserving water for ecosystem services has only recently emerged as, during the 20th century, more than half the world's wetlands have been lost along with their valuable environmental services. Increasing urbanization pollutes clean water supplies and much of the world still does not have access to clean, safe water. Greater emphasis is now being placed on the improved management of blue (harvestable) and green (soil water available for plant use) water, and this applies at all scales of water management. Ocean circulation patterns have a strong influence on climate and weather and, in turn, the food supply of both humans and other organisms. Scientists have warned of the possibility, under the influence of climate change, of a sudden alteration in circulation patterns of ocean currents that could drastically alter the climate in some regions of the globe. Ten per cent of the world's population - about 600 million people - live in low - lying areas vulnerable to sea level rise. Hence there is need for sensitizing those people of the dangers associated with the realities of climate change. The world celebrated World Water Day on the 22nd of March 23, 2021, to this end, may we continue to enjoy this unique and useful gift of nature; water!
